Tse x50 v2 4 crack 30This application claims the benefit of Korean Patent Application No. 1998-36512, filed on Mar. 8, 1998, which is hereby incorporated by reference. 1. Field of the Invention The present invention relates to a semiconductor device and its method of manufacture, and more particularly to a semiconductor device having an improved patterning process and a method of manufacturing the same. 2. Description of the Related Art A semiconductor device is formed in a semiconductor substrate (or, a wafer). After a transistor is formed in the semiconductor substrate, metal wirings are formed in an insulating layer to connect the transistors. FIG. 1 is a cross-sectional view of a semiconductor device having metal wirings according to the conventional art. As shown, a P-well 103 is formed in a P-type semiconductor substrate 101. N-wells 105 and 107 are formed in an active area 103A that is a predetermined portion of P-well 103. Transistors, including a gate electrode 109, source/drain diffused regions 111, 113, 115 and 117, a gate insulating film 113A and a gate spacer 119 are formed on P-well 103. Metal wirings 121, 123 and 125 are formed on top of an insulating layer 117A, and contact plugs 125A and 127A are formed in the source/drain diffused regions 113 and 117. However, when metal wirings are formed using a conventional reactive ion etch (RIE) process, organic materials remaining on a semiconductor substrate cannot be sufficiently removed after forming a conductive metal wiring. As a result, the resistivity of metal wirings is increased. Also, when a conductive metal layer and an insulating layer are laminated using a conventional photolithography 1cb139a0ed
